Hello, i created .tgz backups of my vms using vzdump.
I accidentally deleted vms, its files just disappeared i dont know how.

So what i did is that i restored backups by vzdump, but result is that i can SSH into a VM etc, i can also use their IP to access control panel on VPS, BUT, domains not working, domains pointed to all VPS...

newly created VM works with domains, but when i restore my backup tgzs, websited/domains dont resolve, i see VPS software, zones are OK, issue is in VM openvz files, but im totally unsure how to discover cause.

Please kindly do you have ideas, commands i should do? Thank you alot

vzdump is product made by proxmox, therefore you should ask them.

Thanks, i solved this fortunatelly, the issue was that vzdump dont backed up /var/log/httpd folder and HTTPD (Apache) failed to start without this folder there, so i just created this folder and started apache.
