Hi,

when i get OpenVZ VPS as an user, any way how to discover how much Mhz is assigned or
impossible to do?

What command / conf setting are you using to limit the CPU?

What do you see when you look at the CPU data from within the VM and what do you expect to
see instead?

I see 3,4Ghz cpu (one thread) assigned to my 128MB VPS when i do cat /proc/cpuinfo, i want it to
be 340Mhz..
