Subject: How to use tc to limit traffic? Posted by postcd on Tue, 11 Mar 2014 17:01:34 GMT View Forum Message <> Reply to Message

Hello, how one can use tc (man page) to limit outgoing and incoming traffic on OpenVZ virtual machines?

There is a guide: https://wiki.openvz.org/Traffic_shaping_with_tc#Limiting_inc oming_bandwidth

says: Quote: Limiting outgoing bandwidth

We can limit container outgoing bandwidth by setting the tc filter on eth0.

DEV=eth0 tc qdisc del dev \$DEV root tc qdisc add dev \$DEV root handle 1: cbq avpkt 1000 bandwidth 100mbit tc class add dev \$DEV parent 1: classid 1:1 cbq rate 256kbit allot 1500 prio 5 bounded isolated tc filter add dev \$DEV parent 1: protocol ip prio 16 u32 match ip src X.X.X.X flowid 1:1 tc qdisc add dev \$DEV parent 1:1 sfq perturb 10

X.X.X.X is an IP address of container. [edit] Limiting incoming bandwidth

This can be done by setting the tc filter on venet0:

DEV=venet0 tc qdisc del dev \$DEV root tc qdisc add dev \$DEV root handle 1: cbq avpkt 1000 bandwidth 100mbit tc class add dev \$DEV parent 1: classid 1:1 cbq rate 256kbit allot 1500 prio 5 bounded isolated tc filter add dev \$DEV parent 1: protocol ip prio 16 u32 match ip dst X.X.X.X flowid 1:1 tc qdisc add dev \$DEV parent 1:1 sfq perturb 10

Note that X.X.X.X is an IP address of container.

I see these are commands, probably need to run one by one? But first is DEV=venet0 and DEV=eth0, so im unsure how to limit certain container in example?

Thanks if you have any idea

DEV variables should be set according to your environment - it's quite possible that eth0 and venet0 are the correct values. Also, you must set the IPs (note the X.X.X.X in the code). That's how you limit a certain container - by specifying its IP.
