Hi,

I want to setup a db server that is just reachable at a private 192.168.x.x address.
What do I have to look at?

Just setting a private IP at my webserver and same subnet ip at the db server?
(192.168.0.1 at webserver additional IP and 192.168.0.2 at the db server - and pointing to that
internal IP from my webserver?)

Is it that easy?

Regards

You could add a layer of security: add iptables rules on the HN so that it doesn't accept any
connections from eth0 to 192.168.x.x
Just in case 192.168.x.x is routed to, or present on the local LAN.

Thanks a lot for your reply.
I will do so and report any issues to the community.

Regards
Christian
