I cant find this.

Existing VM and i want to apply another osteamplate on it.

`vzctl create 102 --ostemplate centos-6-x86_64`

is for creation, but i want to keep VM specs etc, just apply another osteamplate

when creating you can give a option `--config <name>` and then this config will be applied to new ct

when setting you can use:

`vzctl set --applyconfig <name>`

otherwise you can stop CT just edit `/etc/vz/conf/[ctid].conf` file and start CT.
