Hello, over IPMI interface i seen server is booting into openvz kernel and then is stuck at bringing up interface eth0:

Please kindly anyone help me how to fix this issue

Update: i restarted IPMI kvm session and after a while server booted OK.

It's hard to help you as you're not giving us much information to go on.

Which vzkernel version is failing at boot? What hardware, which network card?

Is an older vzkernel booting normally? How about a stock OS kernel? If so, which ones?

What do you see in the boot logs when the failure occurs?
