After some time the public IPs on my VPS's stop working. The only way to make them work again is to delete and readd the IP with vzctl.

Is there a way to fix this or to fix the routing or arp entries manually without doing the above?

I've found that running the following fixes it so a hack job fix could be something like a cron script running this every minute:

ifup venet0
Bringing up interface venet0:
Configuring interface venet0:
net.ipv4.conf.venet0.send_redirects = 0
Configuring ipv6 venet0:
RTNETLINK answers: File exists

I think there was similar topics about this issue in the past.

it can be related to NEIGHBOUR_DEVS=detect setting in /etc/vz/vz.conf

what interface you are using? I mean is it eth0 or something else.?
