Hello gays

I like and use openvz under centos. I do not know what will happen if I un "yum update" .

Can I safely update the centos each month, for instance? Whether the expected problems. For me it is very important to know your opinion.

thanks in advance.

You can and you should update your server regularly. Same goes for your containers.

The only specific caveat in regards to openvz is making sure that you boot into an openvz kernel, not your centos' regular one, after a reboot.
