Hi All,

Thanks for your read! Can I ask one question here ? when I use vzmigrate --online to do the live migration, if I run the ./a.out in the container, during the migration time, whether this ./a.out application in container will be terminated? Based on --online description, this application can not be terminated, but I am not sure, because I found sometimes the application in container would be stopped during the migration.

any help would be appreciated!

Thanks for your time and consideration!

Generally, an application should not be terminated.

With the information available, it's impossible to say if any application specific caveats apply.
