
Subject: *SOLVED* Java: Could not reserve enough space for object heap
Posted by [hm2k](#) on Mon, 02 Oct 2006 16:01:40 GMT

[View Forum Message](#) <> [Reply to Message](#)

I am running CentOS on the hardware node with OpenVZ, running a Fedora VPS.

I am trying to run software that uses Java, and I keep getting the following error:

Quote:-bash-3.00# /usr/java/jre1.5.0_06/bin/java -version
Error occurred during initialization of VM
Could not reserve enough space for object heap
Could not create the Java virtual machine.

How can I fix this?

Thanks.

Thanks, but I am already aware of this and am looking for more specific information.

As you can see below, this VPS has not yet reached its limits.

Quote:-bash-3.00# cat /proc/user_beancounters
Version: 2.5

uid	resource	held	maxheld	barrier	limit	failcnt	
102:	kmemsize	3573946	4756589	4752512	4936012		67

This is most likely due to the fact that java requires contiguous blocks of memory when it starts up at least equal to your memory settings in java.

It's difficult to guarantee there are large enough contiguous blocks available in a VPS.

I found that out with an app we run that requires 2GB+ of RAM ... our solution was to move to 64-bit OS and buy lots of RAM. Contiguous block errors aren't eliminated but they are certainly reduced.

Or it could be that privvmpages is hitting its limits.

I really don't believe that there is a problem with the contiguous memory blocks - I'm running openVz on several different hardware nodes using CentOS 4.[3|4] (vps and host OS) 32-bit. These VPS run resource intensive java-apps like zimbra, alfresco, JBoss Portal and so on without any problems. Several smaller tomcat apps are running on these servers, too. No problems since more than eight months.

Ensure that your memory setting of the VM correspondent with the memory settings of the VPS and remember that the OS itself needs some memory.

Regards,

Frank

I have had this problem in the past. The reason why Java complains is because on start up, it sees that the machine has more than 2 GB of RAM, so it starts up in server mode, which tries to allocate all the memory, which then fails because it is inside a VPS.

You can manually specify -Xmx256m on the command line every time you start Java to avoid Java trying to allocate all the memory.

If you want something more seamless, go under the /usr/java/jdk/jre/lib/i386, delete server, and symlink server to client. This is a sneaky way of changing the server VM to the client VM, but it works very well (as long as you don't need the server VM).

[View Forum Message](#) <> [Reply to Message](#)

```
-bash-3.00# /usr/java/jre1.5.0_06/bin/java -version -Xmx256m
Error occurred during initialization of VM
Could not reserve enough space for object heap
Could not create the Java virtual machine.
```

Still not working...

resource	held	maxheld	barrier	limit	failcnt
privvmpages	23499	38193	69152	73575	6

The held and failcnt has increased since I have run it a couple of times since, however nothing else has changed, no limits or barriers appear to have been reached, even though the failcnt has increased.

What could be the problem?

Quote: The held and failcnt has increased since I have run it a couple of times since, however nothing else has changed, no limits or barriers appear to have been reached, even though the failcnt has increased.

You should set barrier/limit so high, that no failcounters will appear! Just try to increase barrier/limit to extremely big value, run java, then mark maxheld. And set barrier/limit for example to $(\text{maxheld} + 0.25 * \text{maxheld})$.

hm2k wrote on Tue, 03 October 2006 08:06-bash-3.00# /usr/java/jre1.5.0_06/bin/java -version -Xmx256m

Error occurred during initialization of VM

Could not reserve enough space for object heap

Could not create the Java virtual machine.

Still not working...

resource	held	maxheld	barrier	limit	failcnt
privvmpages	23499	38193	69152	73575	6

The held and failcnt has increased since I have run it a couple of times since, however nothing else has changed, no limits or barriers appear to have been reached, even though the failcnt has increased.

What could be the problem?

It looks like your total limit is about 256 MB for the VPS. Did you try lower value of -Xmx? Try -Xmx32m. Remember too that the value specified is only for the Java heap (the actual JVM memory usage will be higher), so you can't just specify a value that is at the limit of your VPS's memory allocation.

```
privvmpages    23499    297144    369152    373575        7
```

It works now I increased the privvmpages.

```
-bash-3.00# /usr/java/jre1.5.0_06/bin/java -version
```

```
java version "1.5.0_06"
```

```
Java(TM) 2 Runtime Environment, Standard Edition (build 1.5.0_06-b05)
```

```
Java HotSpot(TM) Server VM (build 1.5.0_06-b05, mixed mode)
```

Hi

I am the same problem and java not work

```
[root@server bin]# ./java -version -Xmx32m
```

```
Error occurred during initialization of VM
```

```
Could not reserve enough space for object heap
```

```
Could not create the Java virtual machine.
```

```
# cat /proc/user_beancounters
```

```
resource    held maxheld barrier limit  failcnt
```

```
privvmpages 88170   88214   131072 139264 514635127
```

I am runing vps in centos 4.5 on 64-bit amd.

Any solution

privvmpages is the amount of memory than can be allocated by processes, it does not account memory use

vmguarpages is the memory guaranteed for use, and it is woefully low at 6144 (looks like the default config for pong)

oomguarpages is accounting the actual memory use and you can see it far exceeds vmguarpages

guys plz read up in the wiki on /proc/user_beancounters

AND WARNING! dont take the default config and try to adjust it up for a Java machine because there is zero match to your hardware. use vzsplitt 8 or 16 or more ways to discover your hardware capabilities

There's a more elegant way to modify the default VM type that's used on Linux. This can be set in /etc/java-1.5.0-sun/jvm.cfg

Mine now looks like:

```
#-client IF_SERVER_CLASS -server  
-client KNOWN  
-server KNOWN  
-hotspot ALIASED_TO -client  
-classic WARN  
-native ERROR  
-green ERROR
```

Greets

Christian
