Hi everybody. In order to lock and control the max size of a directory, I want to create a zero-file and format it in ext4 (no_journal). I cannot mount it because I got no loop device. I'm in a container with no acces to host. I searched the net, did not find anything.

I'm trying to apply a quota on a subfolder of /var/www ... If you got another solution, I'm OK

User quotas won't work in this case? Unfortunately partition quotas aren't available on bind mounts which are usually what I use inside containers.
