Hello i read scripts on openvz.org/Ploop/Backup

Quote:

vzctl snapshot \$CTID --id \$ID --skip-suspend --skip-config

Perform a backup using your favorite backup tool # (cp is just an example) cp \$VE_PRIVATE/root.hdd/* \$BACKUPPATH/

Delete (merge) the snapshot vzctl snapshot-delete \$CTID --id \$ID

Why merge run after cp? Also, i can copy only root.hdd, without snapshot if snapshot already merged and deleted?

You don't want to keep a snapshot running after the copy because it creates a large amount of overhead for the filesystem.

Merging it basically closes out the snapshot. You merge all the changes made while the snapshot was open.
