Hello everyone,

May I ask -

If I install a CentOS 6.5 x64 host with OpenVZ x64 kernel (e.g. 2.6.32-042stab090.3), is it possible to run

1. CentOS 5.10 x64 guest ?
2. CentOS 4.9 x86 guest (some legacy application)?

I cannot find a (official) supported list of host OS and guest OS inside [openvz.org](http://openvz.org) website.

Thank you very much for your kind experience sharing.

Regards

CentOS 5.x templates run without issues and your x86\_64 host should allow for both x86 and x86\_64 guests.

As for EOL'ed CentOS 4.x templates, it's quite likely they run, but I'm almost certain that nobody tests them with newer openvz kernels.

I run one CT with centos4 on centos6 openvz host and it works just ok.  
and btw this CT is on ploop. works ok.

The list of supported guest templates is here:  
<http://openvz.org/Download/templates/precreated>

There is typically both a 32 bit and a 64 bit version of each guest OS.
