I have OpenVZ VPS with Debian and 3 days later I was mistakenly overwritten 2 files (index.php and style.css) using WinSCP. Is there any way to recovery these files?

Of course I used search before asking, but I have problem with finding filesystem, because command:

df -h

Filesystem	Size	Used	Avail	Use%	Mounted on
/dev/simfs	444G	148G	274G	36%	/
tmpfs	1.0G	0	1.0G	0%	/lib/init/rw
tmpfs	1.0G	0	1.0G	0%	/dev/shm

So when I used for example:

scalpel /dev/simfs -o output

Scalpel version 1.60

Written by Golden G. Richard III, based on Foremost 0.69.

ERROR: You have attempted to use a non-empty output directory. In order to maintain forensic soundness, this is not allowed.

Aborting.

I want try use this tutorial: www.pronique.com/blog/howto-recover-deleted-php-files-using-scalpel

Can you help me with this problem? Thanks
