Hi guys,
Im experiencing problem with setting up ipv6 protocol on my debian 7 system, hardware server with openvz kernel.
When pingin google Im gettin

```
$ ping6 ipv6.google.com
socket: Address family not supported by protocol
```

Following some google results Ive modified sysctl.conf file

```
net.ipv4.ip_forward=1
net.ipv4.conf.all.rp_filter=1
net.ipv4.conf.default.proxy_arp=0
kernel.sysrq=1
net.ipv6.conf.eth0.autoconf=0
net.ipv6.conf.all.enable_ipv6=1
net.ipv6.bindv6only= 1
net.ipv6.conf.default.forwarding=1
net.ipv6.conf.default.proxy_ndp=1
net.ipv6.conf.all.forwarding=1
net.ipv4.conf.all.send_redirects=0
net.ipv6.conf.all.proxy_ndp=1
net.ipv4.conf.default.send_redirects=1
```

I added ipv6 to module

```
# /etc/modules: kernel modules to load at boot time.
#
# This file contains the names of kernel modules that should be loaded
# at boot time, one per line. Lines beginning with "#" are ignored.
# Parameters can be specified after the module name.
```

```
loop
ipv6
```

And yes, I rebooted after all this Any ideas ?

EDIT

Forgot bout my openvz config file @ /etc/vz/vz.conf

```
# Disable module loading. If set, vz initscript does not load any modules.
#MODULES_DISABLED=yes
```

```
# The name of the device whose IP address will be used as source IP for CT.
# By default automatically assigned.
#VE_ROUTE_SRC_DEV="eth0"

# Controls which interfaces to send ARP requests and modify ARP tables on.
NEIGHBOUR_DEVS=all
