Hi!

I've updated yesterday to 026test018.1 from 026test017.

Since this point one of our VPS runs into failcnt. With 026test017 everything is fine.

Version: 2.5

Just increase limits. 018 kernel uses a bit more resources, I suppose.

This is a BUG found in numfile accounting. This patch fixes it.

Whats with the shmpages?

Stefan

Are you asking what the shmpages metric is? If so, check out the UBC chapter of the openvz wiki.
If you are asking why it has exhausted the barrier of your UBC configuration, you need to analyze the applications consuming memory in your VE..

No I meant if this is also a bug like numfile - or why it is in failcnt since update.

But with the patch of numfiles - the problem with shm is also gone.

So thanks a lot.
