Hello everyone,

Im Nicolas, from a new french provider.

So, we have more VPS everyday and we are facing an upsurge ddos attack for several customers. They use our vps to launch the attack. Result , completely saturate a network , even today...

The question is : Do you have a robust script or iptables can block/suspend/delete ip or ... more of a container when a ddos atack is detected ?

Specific information : 99% of ddos attack is send by our VPS, 1% external network recive

Many, many thanks

Sincerely
NL

Hi Nicolas,
You might want to check out how we dropped UDP-Flood attacks by our users:
blog.codeanywhere.com/openvz-tc-and-udp-flood

Let me know if you need any help.
