Hi,

I'm new to openvz and have just installed it on a Debian 2.6.8 system. I
used the Debian 3.1 template and trying to install asterisk, but it needs
the source files for the '2.6.8-022stab078-up kernel'. Does anybody know
where or how I get the source for the kernel?

Thanks,

Dean Bath

Dean,

have you tried this HOWTO
http://wiki.openvz.org/Asterisk_in_VE_with_debian_stable
?

Kernel sources and config files can be taken from:
http://openvz.org/download/kernel/stable/
 http://download.openvz.org/kernel/stable/022stab078.21/patch
es/patch-022stab078-combined.gz
 http://download.openvz.org/kernel/stable/022stab078.21/confi
gs/kernel-2.6.8-022stab078-i686.config.ovz

patch-022stab078-combined.gz applies to mainstream 2.6.8 kernel.

Take a look at this kbuild HOWTO also:
 http://wiki.openvz.org/Kernel_build#Rebuilding_kernel_from_s ources

Thanks,
Kirill

What you need is just to copy the kernel include files from the host
system into your VE.
