
Subject: Intermittent freeze at "initializing hardware... storage network audio"

Posted by [fgomes](#) on Wed, 11 Oct 2006 09:39:37 GMT

[View Forum Message](#) <> [Reply to Message](#)

I have a server with Dual Opteron CPU using CentOS 4.4 with OpenVZ RHEL4 kernel (ovzkernel-smp-2.6.9-023stab016.2.x86_64.rpm).

After some initial problems to put everything working in 64 bits (it was the first 64 bit linux I install), now I manage to have several VEs running well and stable. The problem that I found lately is that the system sometimes hangs when booting the hardware node (about 50% or less of the boot times), at "initializing hardware... storage network audio". I usually reset it and enter in interactive boot and it always boot normaly when using interactive boot.

What can I do to diagnose this hanging problem?

What exactly does it mean ""initializing hardware... storage network audio"? The system has no audio... It is a server board and transport from Tyan - Tiger K8SSA (S3870) -

<http://www.tyan.com/products/html/tigerk8ssa.html>

Another doubt I have is if it can be related with the kernel used. I'm using RHEL 4 kernel, because is the most similar to the CentOS 4.4 (I think), am I correct, or should I change to the OpenVZ stable kernel (ovzkernel-smp-2.6.8-022stab078.21.x86_64.rpm)?

Thanks for all your help!

Fernando

Do you have a serial console on this machine (it is used for debugging, see

http://wiki.openvz.org/Remote_console_setup for details)?

If you have then please Alt-SysRQ-P 5 times, then Alt-SysRQ-T and post here logs.

[View Forum Message](#) <> [Reply to Message](#)

Can you press AltSysRq-P multiple times and AltSysRq-T when it hangs? Thanks!

[View Forum Message](#) <> [Reply to Message](#)

Not much success with SysRq, it only writes SysRq: when I press Alt-SysRq-P or Alt-SysRq-T, both on the console and by the serial port

I've made more than 10 boots now, it failed twice.
The hard disks are connected to a 3ware 9550SX, there are no disks on the motherboard
harddisk controllers.

The most strange things I saw in this log is that sometimes I have this (2d and 3d reason):

Uhuh. NMI received for unknown reason 3d.
Dazed and confused, but trying to continue
Do you have a strange power saving mode enabled?

and always have this:

..MP-BIOS bug: 8254 timer not connected to IO-APIC
failed.
timer doesn't work through the IO-APIC - disabling NMI Watchdog!
works.

Here is the log when it hangs:

Bootdata ok (command line is ro root=LABEL=/ console=ttyS0,57600 console=tty debug
silencelevel=8)

Linux version 2.6.9-023stab016.2-smp (root@rhel4-64) (gcc version 3.4.5 20051201 (Red Hat

it looks like you have too strict loglevel.

Try pressing AltSysRq-8 before AltSysRq-p and -t.

It should print call traces now.
