Hello!

I want increase RAM of my VPS.

vzctl set 105 --oomguarpages 2G --save
vzctl set 105 --oomguarpages 2G --save
vzctl set 105 --privvmpages 2G:3G --save
CT configuration saved to /etc/vz/conf/105.conf

But I see it is unsuccessful, because

vzctl exec 105 free -m
total used free shared buffers cached
Mem: 1512 113 1398 0 0 51
-/+ buffers/cache: 62 1449
Swap: 2048 0 2048

Before it worked..

Please help, how can I increase memory?

Hello,

There are
OS - Centos 6.6
kernel - 2.6.32-042stab102.9
vzctl-core-4.8-1.x86_64
vzctl-4.8-1.x86_64

on server

P.S. I can increase diskspace, inode, etc. I cannot increase only RAM.
