
Subject: Monitor Container Bandwidth Consumption

As the topic states, we are looking for a way to determine the current rate of transfer that each specific container is using. This is not bandwidth graphs using total transfer like we can already see from applications such as SolusVM. We want to be able to see if a container is currently transferring data at 100kb/s, 10Mb/s or whatever the case might be. We've recently had some issues with some containers maxing out their connections and causing issues within the host server (dropping packets, etc). Being able to determine quickly who the culprit is would allow us to fix the issue quickly and to do this, we need to know at what rate of transfer each container is currently consuming.
