Hi,

trying to install openvz-iso-7.0.0-3469 on a VirtualBox VM. (Need to have done that, before attempting bare metal.) Now, right after finishing the Grub menu, I get a message "Virtualization technology requirements not met", and a choice between "I want to exit.", and "I want to proceed." Any ideas on how to make that go, for example by changing my VM settings?

Thanks,

Jochen

Maybe its because it now has KVM support and that isn't supported in virtualbox

<http://askubuntu.com/questions/328748/how-to-enable-nested-virtualization-in-ubuntu>

OpenVZ provides two types of virtualization: hypervisor based (aka virtual machines) and containers (os level virtualization).

OpenVZ 7.0 uses KVM/QEMU as a hypervisor, it requires hardware support for full support. In case of absence

HW support you can use virtual machines with limitations: only 1 vCPU and AFAIK limited memory amount.
