What is the recommended setup for running OZ 7.x as an OS installation using your ISO if I want mySQL/MariaDB on a 240gB SSD drive? The normal settings are /, /root /swap and /vz when using 2TB of RAID1? I need to tell my dedicated server company. This will be a web server using cPanel and Plesk. I realize that once I create a container THAT is were I would need the structure of using the SSD. But how do I map a directory of /var/lib/mysql in a multi-container environment?

Thank you.
