Hi,
I have problem. I have 2 very old servers with openvz (debian 5.0.6, kernel 2.6.26-2-openvz-amd64, vzctl version 3.0.22). I know very - very old.
I need to upgrade them to newest but problem is how to migrate virtual hosts. Some of them has got installed software to which I don't have sources or configuration in brand new environment is very hard. How to migrate these virtual hosts ?

Wojtek

Yep, quite old.

The universal plan for each Container is:

- 1) get new version (Virtuozzo 7 now), install on another node
- 2) create a new Container on Virtuozzo 7 node
- 3) configure new Container taking into account old Container configuration
(you can try to adjust disk space of the new Container and then just take old Container config and put it instead of new CT config.

This probably won't work out of the box, but you can quickly find which settings are missing)

- 4) stop old Container, mount it; stop new Container, mount new Container, copy data from old Container to the new one

That's it.

Hope that helps.
