Hello,
We have just setup our first OpenVZ node with 6x SSD drives in Hardware RAID-10 with 1GB cache. We can get 500-700MB/s on the main host node but only get around 30MB/s on Virtual Machines inside, I/O Priority in SolusVM set to 7 (maximum value). We have tried several OS (CentOS, Ubuntu, Debian) for the virtual machines but still the same result. Is there any settings that we missed here?
Thanks!
