Subject: Sync files between Containers

Hello I have a problem still unsolved here, I have two containers in different data centers and plan to mount a redundancy in a service that I provide, set up the Cluster Mysql and it is 100% functional, however I am facing problem to configure a solution to synchronize / var / www system.

Initially I tried to set the glusterfs, I know it works well, since I have worked with the same on physical machines, however apparently it needs advanced permissioning to work on OpenVZ, which is not possible in the provider where you have instances.

Do you have any solution to tell me? I do not know what to do, did not want to leave for footlights as rsync multi directional or anything like that.

Thank you in advance for any solution that might indicate me.

Sincerely Tácio Andrade.
