Subject: VMWare Server vs OpenVZ Posted by lupacexi on Wed, 06 Sep 2017 20:02:47 GMT View Forum Message <> Reply to Message

Hi guys

As we all know that openvz is using operating system level virtualization. After googling around reading the datasheet and all the available information on VMWare website I could not manage to know which virtualization technique VMWare server is using. Is it using full virtualization (hypervisor). anyone knows any place where I can find the software and the vz technique e.g openvz os-level

Best regards

I've been an OpenVZ user for many years. I'm wondering if there's and reason why I should upgrade to Virtuozzo? And - how much does it cost? I can't find pricing on the web site. Is there any significant advantages?

This is for my spam filtering company. Currently have about 12 servers running about 50 containers.

OpenVZ is a Linux based virtualization platform that allows a physical server to run multiple isolated OS and that knows as containers, OpenVZ run OS such as Centos, Fedora, Gentoo, and Debian. &

VMware KVM, XEN, platforms can be grouped into the same category, the main difference is that they do have will not be noticeable on the virtual server and end-user

I think the main difference is "support" and possibly hosting more containers on a server.

If however you are a small hosting company its not really a "requirement" - stick to openvz and kvm for certain tasks.
