Hi,

I'm really new to OpenVZ and was able to create two containers in a server, one with Debian 8 (IP=192.168.100.100) and another one with CentOS 7 (IP=192.168.100.101).

I can access the Debian container (via ssh and vzctl enter) without problem, but I can't ssh into the CentOS. The only way to enter into this container is via vzctl enter

I can ping the IP 192.168.100.101, so it's there, but I can't log via ssh user@192.168.100.101 or root@192.168.100.101

```
$ ping 192.168.100.101
```

```

What could be the problem?
