Hi, well I've been playing with OpenVZ for a couple of days now. I got everything working, got a VPS setup and can ssh into it from the local server. However, I just do not know how to get it to talk through the ethernet device. I set the IP through vz, added a hostname, etc, etc.

Does anybody have a walkthrough to get the VPS IP's to resolve? I did not home the IP to the box, when I do that the box takes over the IP's and not the VPS. I also made sure ssh on the main server was binded to the main server IP.

Any sugestions? I really want to use this program as it is the solution I need to setup VPS servers.

So as I understand your VPSs are not available from outside. Could it be the case that you have forgot to enable ip forwarding?

Make sure that cat /proc/sys/net/ipv4/ip\_forward shows 1. If not, you can do echo 1 > /proc/sys/net/ipv4/ip\_forward to fix the problem immediately.

For proper fix, see Quick Install article, or User's Guide (look for 'Sysctl configuration').
