Hi Everyone,

I am looking to setup KSM on my OpenVZ 7 node, however yum is noting an conflict on installation.

```
[root@ /]# yum install ksm
Loaded plugins: fastestmirror, langpacks, openvz, priorities, vzlinux
Loading mirror speeds from cached hostfile
* openvz-os: mirrors.evowise.com
* openvz-updates: mirrors.evowise.com
102 packages excluded due to repository priority protections
Resolving Dependencies
--> Running transaction check
---> Package ksm-vz.x86_64 10:2.12.0-18.6.5.vz7.36 will be installed
--> Processing Conflict: vcmmmd-7.0.165-1.vz7.x86_64 conflicts ksm
--> Finished Dependency Resolution
Error: vcmmmd conflicts with 10:ksm-vz-2.12.0-18.6.5.vz7.36.x86_64
You could try using --skip-broken to work around the problem
You could try running: rpm -Va --nofiles --nodigest
```

```
[root@ /]# uname -r
3.10.0-957.12.2.vz7.96.21
```

Any advice would be greatly appreciated.

Thanks!

Virtuozzo uses own memory management daemon vcmmmd that properly works with containers and VMs.

It is installed by default and we have marked it as one conflicted with KSM.

If you want you can disable vcmmmd service install ksm with force and enable it, however we did tested how stable it works with OpenVZ7 now.

Thank you,
Vasily Averin
