Subject: Ploop Incremental backups strategy Posted by Steffan_N on Tue, 08 Sep 2020 14:09:27 GMT

View Forum Message <> Reply to Message

Hello,

Using openvz7
Im looking ad my backup strategy
I allways used rsync on openvz6

And looks like on openvz7 this can also be done on /vz/root/VEID But i dont know if i can do a full restore from that...

Now im looking at snapshots https://github.com/TamCore/vzpbackup it can make full backups and incremental backups

Is someone using this script?
i have some question hope someone can help

the incremental backups are nice to save space and time on a remote backupserver But how does a restore works.

For what i know you can only restore a full snapshot, the incremental backups have only the changed files

Question 2.

Is it possible to extract a file from the backup for a single file restore? And if so can someone tell me how?

Thanxs Steffan

Hey Seffan,

I can't answer your questions about vzpbackup, however I can say that using rsync (or borgbackup) with /vz/root/VEID mounts does work. Restoring is a matter of:

- 1. Creating a new container OR using the saved container conf file to re-create the same container
- 2. Mount the ploop disk
- 3. Completing a full restore (ensure to use rsync's numeric IDs parameter and save all perms, OR

use borgbackup as it will do all this for you) to the mount point

- 4. Unmount
- 5. Start container

Borgbackup is pretty handy as it handles your rsyncing, deduping, encryption, and compression for you.
