Has anyone spotted this on an OpenVZ 7 host node messages log?

Mar 20 15:14:43 sr04 kernel: host fs is too fragmented: average extent size is lesser than 2233949 bytes

Mar 20 15:14:43 sr04 kernel: Purging lru entry from extent tree for inode 145489924 (map_size=321945 ratio=31%)

Seems to be indicating the disks on the node need defragmentation, however I've always understood it that SSDs don't require defragmentation.

Thoughts?
