All,

OK, Here is the deal.

I got FC4 installed on a Dell poweredge 1850

I use the yum repo method and install the openvz kernel, modify grub.conf so it boots the correct kernel, and reboot. Then install the rest of the tools.

I successfully create a VPS, everything goes smoothly, assing it an IP addy, and start the VPS.

Again, everything runs smoothly but no network connectivity on the VPS's. Any thoughts/Ideas?

Is there something I have to do on a yum repo install that I am missing?

Hello,

What is exact problem? Can you ping HN, other VEs, nodes in you subnet? Your network configuration file.

Also, please, check /proc/sys/net/ipv4/ip_forward: it should has '1' in it.

Thanks,

vass.
