Hi,

a look to the man page of vzctl shows me that the "ipt_MASQUERADE" is not in the IPTABLES MODULE LIST!

So you can't use the module ipt_MASQUERADE!

--iptables name

Restrict access to iptables modules inside a VE (by default all iptables modules that are loaded in the host system are accessible inside a VE).

You can use the following values for name: iptable_filter, iptable_mangle, ipt_limit, ipt_multiport, ipt_tos, ipt_TOS, ipt_REJECT, ipt_TCPMSS, ipt_tcpmss, ipt_ttl, ipt_LOG, ipt_length, ip_conntrack, ip_conntrack_ftp, ip_conntrack_irc, ipt_conntrack, ipt_state, ipt_helper, iptable_nat, ip_nat_ftp, ip_nat_irc, ipt_REDIRECT xt_mac.
