Hi, I have gotten your kernel to work on 2 different servers but when I installed it on my 3rd server I get the following error:

root@viking [~]# rpm -ivh ovzkernel-2.6.8-022stab056.1.i686.rpm

warning: ovzkernel-2.6.8-022stab056.1.i686.rpm: V3 DSA signature: NOKEY, key ID a7a1d4b6

Preparing... ########################### [100%]
1:ovzkernel ############################# [100%]

stdin: is not a tty stdin: is not a tty

No module ata_piix found for kernel 2.6.8-022stab056.1, aborting.

mkinitrd failed

error: %post(ovzkernel-2.6.8-022stab056.1) scriptlet failed, exit status 1

My exisiting kernel is: CentOS-3 (2.4.21-37.ELsmp)

The hard drives I do beleive are SATA.

First, CentOS 3 is not for 2.6 kernel, you'd better use CentOS 4. CentOS 3 might lack some stuff needed for 2.6 kernels, such as module-init-tools.

ata_piix is built-in OpenVZ kernel, that is why mkinitrd fails here. I think that more recent versions of mkinitrd does not fail - they just print warning instead. So upgrading to CentOS 4 might help here as well.

Finally, we are going to release vzkernel-install package with our own version of mkinitrd which is tailored to OpenVZ kernel.

Oh no, you should upgrade to CentOS 4 _distribution_, not only kernel.
