Subject: rsync problem Posted by till on Thu, 09 Nov 2006 15:11:26 GMT View Forum Message <> Reply to Message

Hello,

I have a problem again.

I try to rsync my server to back it up(via snapshot). The prog uses this cmd to do so: /usr/bin/rsync -azHx --delete --numeric-ids --relative --delete-excluded --stats --rsh="/usr/bin/ssh -c blowfish" root@ip.here://var/cache/rsnapshot/hourly.0/myserver/

Looks good. On the one vz it works good. The other one crashes. I cant login via ssh or so. via vzctl I can enter. But I have to restart the vz to get it back to work.

This is the user_beancounters for the box that works:

lockedpages04072409640961175privvmpages1537552619992621442929123945shmpages69213481310721310720dummy00000numproc77895005000physpages871813130021474836470oomguarpages006144 21474836470oomguarpages8718131306144 21474836470numtcpsock575005000numflock382002100numsiginfo035125120tcpsndbuf469562191285365760104857600othersockbuf44721320001320963368969956dgramrcvbuf02236150323240632320numothersock5155005000dummy000000dummy00000dummy00000dummy00000dummy00000dummy00000dummy00000dummy00000dummy00000dummy000 <t< th=""><th>101: kmemsize</th><th>256529</th><th></th><th>24974</th><th></th><th></th><th>18022</th><th></th><th>0</th></t<>	101: kmemsize	256529		24974			18022		0

I cant find something in the logfiles.

Runnig now a 2.6.9 Kernel from debian.

1. what do you mean by snapshot? LVM snapshot or what? rsync doesn't do any real(!) snapshots.

2. Do I understand correctly that you run this command from inside VE to backup its data *to* remote server?

- > Looks good. On the one vz it works good.
- > The other one crashes.

1. Can you shed some light on this? rsync requires 2 nodes. So I can't understand what "on the one vz it works, the other crashes" mean.

Do you mean that source node or destination (where backups are stored) crashes? 2. What do you mean by crashes? Does your host system continues to work? Can you ssh to the host? Do you see some kernel messages on the screen? 3. is it reproducable? if yes, can you demonstrate it with exact commands/details and maybe provide us login to resolve it? 4. what are kernel versions on source and destination nodes (uname -a)? have you taken kernels from binary RPMs or rebuilt kernel yourself? what kernel configs have you used? > I cant login via ssh or so. via vzctl I can enter. > But I have to restart the vz to get it back to work. Ok, this makes me believe that host system continues to work, right?

But VE networking somehow stops responding?

Does ping ve-ip-addr works?

Do you mean "restart vz" == "/etc/init.d/vz restart"? If yes, I guess 'vzctl restart VEID' helps as well?

P.S. I renamed the title of your post, since it was too emotional, with too incomplete information.

1. what do you mean by snapshot? LVM snapshot or what? rsync doesn't do any real(!) snapshots.

The program is namend rsnapshot (http://www.rsnapshot.org/). Its something that generates rsync cmds and moves the old files away. Nothing special. Quote:

2. Do I understand correctly that you run this command from inside VE to backup its data *to* remote server?

oke, my fault. The setup: fileserver (for the backup) box with openvz-kernel -->virtual box 1 (works with the rsnapshot/rsync) -->virtual box 2 (does not work with rsnapshot/rsync)

the fileserve runs the rsync cmd. Quote: 2. What do you mean by crashes? Does your host system continues to work? Can you ssh to the host? Do you see some kernel messages on the screen?

After some MB of the rsync, rsync dies. So it does not copy eny more files.

I _can_ ping the virtual box.

I _cant_ ssh the virtual box.

I _cant_ ping from inside of the virtual box.

Quote:

3. is it reproducable? if yes, can you demonstrate it with exact commands/details and maybe provide us login to resolve it?

The good news: It is reproducable. And it is simple. I simply run this cmd from the fileserver: rsync -rv root@ip.of.virtual.box.2.:/ .

Give you access: May be possible. The problem is that this box runs a memberdatabase of two NGOs. Perhaps we will find a way to do this via screen, hm?

Quote:

4. what are kernel versions on source and destination nodes (uname -a)? have you taken kernels from binary RPMs or rebuilt kernel yourself? what kernel configs have you used?

uame -a:

Linux bi-o-mass 2.6.9-023stab032.1-ovz-i386 #1 Thu Oct 26 19:39:19 UTC 2006 i686 GNU/Linux The kernel is from debian testing. I used the binary build of the guys.

Quote:

> I cant login via ssh or so. via vzctl I can enter.

Ok, this makes me believe that host system continues to work, right?

But VE networking somehow stops responding?

Does ping ve-ip-addr wo]rks?

Do you mean "restart vz" == "/etc/init.d/vz restart"? If yes, I guess 'vzctl restart VEID' helps as well?

I restart the machine via vzctl restart VZID. VZ seems running fine as well as the other virtual systems. Normaly it takes ~10 sec to restart this virtual server(2). But in case of doing an rsync before it takes ~60 sec.

I dont find any output in any logfiles. If I have time at the weekend I will drive to the serverroom and look at the screenoutput.

Hello, thanks for your answer!

It does not help. It would be very stange if it would help. The one virtual machine works great with the same settings and does not stop after ~100 mb.

What could I do?

Subject: Re: rsync problem Posted by dev on Mon, 13 Nov 2006 09:37:57 GMT View Forum Message <> Reply to Message

strace -f -tt -v -o out <your command> attach out file here.
