Subject: BC: resource beancounters (v6) (with userpages reclamation + configfs)
Posted by dev on Thu, 09 Nov 2006 16:42:56 GMT
View Forum Message <> Reply to Message

MAJOR CHANGES in v6 (see details below):
- configfs interface instead of syscalls (as wanted by CKRM people...)
- added numfiles resource accounting
- added numtasks resource accounting

numfiles and numtasks controllers demonstrate how
clean and simple BC interface is.

Patch set is applicable to 2.6.19-rc5-mm1

Resource BeanCounters (BC).

BC allows to account and control consumption
of kernel resources used by *group* of processes
(users, containers, ...).

Draft BC description on OpenVZ wiki can be found at
http://wiki.openvz.org/UBC_parameters

The full BC patch set allows to control:
- kernel memory. All the kernel objects allocatable
on user demand and not reclaimable should be accounted and
limited for DoS protection.
e.g. page tables, task structs, vmas etc.

- virtual memory pages. BCs allow to
limit a container to some amount of memory and
introduces 2-level OOM killer taking into account
container's consumption.
pages shared between containers are correctly
charged as fractions (tunable).

- network buffers. These includes TCP/IP rcv/snd
buffers, dgram snd buffers, unix, netlinks and
other buffers.

- minor resources accounted/limited by number:
tasks, files, flocks, ptys, siginfo, pinned dcache
mem, sockets, iptentries (for containers with
virtualized networking)

Summary of changes from v5 patch set:

* configfs interface instead of syscalls (as wanted by CKRM people)
* added numfiles resource accounting
* added numtasks resource accounting
* introduced dummy_resource to handle case when
  no resource registered
* calls to rss accounting are integrated to rmap calls

Summary of changes from v4 patch set:
* changed set of resources - kmemsize, privvmpages, physpages
* added event hooks for resources (init, limit hit etc)
* added user pages reclamation (bc_try_to_free_pages)
* removed pages sharing accounting - charge to first user
* task now carries only one BC pointer, simplified
* make set_bcid syscall move arbitrary task into BC
* resources are not recharged when task moves
* each vm_area_struct carries a BC pointer

Summary of changes from v3 patch set:

* Added basic user pages accounting (lockedpages/privvmpages)
* spell in Kconfig
* Makefile reworked
* EXPORT_SYMBOL_GPL
* union w/o name in struct page
* bc_task_charge is void now
* adjust minheld/maxheld splitted

Summary of changes from v2 patch set:

* introduced atomic_dec_and_lock_irqsave()
* bc_adjust_held_minmax comment
* added __must_check for bc_*charge* funcs
* use hash_long() instead of own one
* bc/Kconfig is sourced from init/Kconfig now
* introduced bcid_t type with comment from Alan Cox
* check for barrier <= limit in sys_set_bclimit()
* removed (bc == NULL) checks
* replaced memcpy in beancounter_findcrate with assignment
* moved check 'if (mask & BC_ALLOC)' out of the lock
* removed unnecessary memset()

Summary of changes from v1 patch set:

* CONFIG_BEANCOUNTERS is 'n' by default
* fixed Kconfig includes in arches
* removed hierarchical beancounters to simplify first patchset
* removed unused 'private' pointer
* removed unused EXPORTS

* MAXVALUE redeclared as LONG_MAX
* beancounter_findcreate clarification
* renamed UBC -> BC, ub -> bc etc.
* moved BC inheritance into copy_process
* introduced reset_exec_bc() with proposed BUG_ON
* removed task_bc beancounter (not used yet, for numproc)
* fixed syscalls for sparc
* added sys_get_bcstat(): return info that was in /proc
* cond_syscall instead of #ifdefs

Many thanks to Oleg Nesterov, Alan Cox, Matt Helsley and others
for patch review and comments.

Thanks,
Kirill

Subject: [PATCH 1/13] BC: atomic_dec_and_lock_irqsave() helper
Posted by dev on Thu, 09 Nov 2006 16:47:20 GMT
View Forum Message <> Reply to Message

Oleg Nesterov noticed to me that the construction like
(used in beancounter patches and free_uid()):

```
 local_irq_save(flags);
 if (atomic_dec_and_lock(&refcnt, &lock))
  ...
```

is not that good for preemtible kernels, since with preemption
spin_lock() can schedule() to reduce latency. However, it won't schedule
if interrupts are disabled.

So this patch introduces atomic_dec_and_lock_irqsave() as a logical
counterpart to atomic_dec_and_lock().

+ bool "Enable resource accounting/control"
+ default n
+ depends on CONFIGFS_FS
+ help
+   When Y this option provides accounting and allows configuring
+   limits for user's consumption of exhaustible system resources.
+   The most important resource controlled by this patch is unswappable
+   memory (either mlock'ed or used by internal kernel structures and
+   buffers). The main goal of this patch is to protect processes
+   from running short of important resources because of accidental
+   misbehavior of processes or malicious activity aiming to ``kill''
+   the system. It's worth mentioning that resource limits configured
+   by setrlimit(2) do not give an acceptable level of protection
+   because they cover only a small fraction of resources and work on a
+   per-process basis.  Per-process accounting doesn't prevent malicious
+   users from spawning a lot of resource-consuming processes.

Subject: [PATCH 3/13] BC: beancounters core and API
Posted by dev on Thu, 09 Nov 2006 16:49:24 GMT

View Forum Message <> Reply to Message

Core functionality and interfaces of BC:
find/create beancounter, initialization,
charge/uncharge of resource, core objects' declarations.

Basic structures:

bc_resource_parm - resource description
beancounter   - set of resources, id, lock

Subject: [PATCH 4/13] BC: context handling
Posted by dev on Thu, 09 Nov 2006 16:51:08 GMT
View Forum Message <> Reply to Message

Contains code responsible for setting BC on task,
it's inheriting and setting host context in interrupts.

Task references beancounter by exec_bc pointer:
exec_bc: current context. All resources are
        charged to this beancounter.

Subject: [PATCH 5/13] BC: configfs interface
Posted by dev on Thu, 09 Nov 2006 16:52:24 GMT

View Forum Message <> Reply to Message

configfs interface to beancounters.
It may be done as module in case configfs itself is a module.

Usage example:

Prepare configfs interface
~~~~~~~~~~~~~~~~~~~~~~~~~~
```
# mount -t configfs none /cfg
# ls /cfg
  beancounters
# ls /cfg/beancounters/
```
~~~~~~~~~~~~~~~~~~~~~~~~~~

```
  0  description
# cat /cfg/beancounters/description
  Beancounters controll resource usage of task groups
```

Look at beancounters subsystem structure
~~~~~~

```
# ls /cfg/beancounters/0/
    id  kmemsize  numfiles  numtasks  physpages  privvmpages  tasks  threads
# ls /cfg/beancounters/0/numfiles
    barrier  failcnt  held  limit  maxheld  minheld
# cat /cfg/beancounters/0/numfiles/*
    2147483647
    0
    163
    2147483647
    345
    0
```

Create a new beancounter and move task into it
~~~~~~

```
# mkdir /cfg/beancounters/1
# echo -n $$ > /cfg/beancounters/1/tasks
# cat /proc/$$/status | grep Bcid
Bcid:   1
```

now you can see bc 1 usages etc.

Signed-off-by: Pavel Emelianov <xemul@sw.ru>
Signed-off-by: Kirill Korotaev <dev@sw.ru>

Subject: [PATCH 6/13] BC: kmemsize accounting (core)
Posted by dev on Thu, 09 Nov 2006 16:53:38 GMT
View Forum Message <> Reply to Message

Introduce BC_KMEMSIZE resource which accounts kernel
objects allocated by task's request.

Reference to BC is kept on struct page or slab object.
For slabs each struct slab contains a set of pointers
corresponding objects are charged to.

Allocation charge rules:
1. Pages - if allocation is performed with __GFP_BC flag - page
   is charged to current's exec_bc.
2. Slabs - kmem_cache may be created with SLAB_BC flag - in this
   case each allocation is charged. Caches used by kmalloc are
   created with SLAB_BC | SLAB_BC_NOCHARGE flags. In this case
   only __GFP_BC allocations are charged.

Subject: [PATCH 7/13] BC: kmemsize accounting (hooks)
Posted by dev on Thu, 09 Nov 2006 16:54:37 GMT
View Forum Message <> Reply to Message

Mark some kmem caches with SLAB_BC and some allocations
with __GFP_BC to cause charging/limiting of appropriate
kernel resources.

Signed-off-by: Pavel Emelianov <xemul@sw.ru>

Subject: [PATCH 8/13] BC: privvmpages accounting (core)
Posted by dev on Thu, 09 Nov 2006 16:56:01 GMT
View Forum Message <> Reply to Message

This patch instroduces new resource - BC_PRIVVMPAGES.
It is an upper estimation of currently used physical memory.

There are different approaches to user pages control:
a) account all the mappings on mmap/brk and reject as
   soon as the sum of VMA's lengths reaches the barrier.

   This approach is very bad as applications always map
   more than they really use, very often MUCH more.

b) account only the really used memory and reject as
   soon as RSS reaches the limit.

   This approach is not good either as user space pages are
   allocated in page fault handler and the only way to reject
   allocation is to kill the task.

   Comparing to previous scenarion this is much worse as
   application won't even be able to terminate gracefully.

c) account a part of memory on mmap/brk and reject there,
   and account the rest of the memory in page fault handlers
   without any rejects.
   This type of accounting is used in UBC.

d) account physical memory and behave like a standalone
   kernel - reclaim user memory when run out of it.

   This type of memory control is to be introduced later
   as an addition to c). UBC provides all the needed
   statistics for this (physical memory, swap pages etc.)

Privvmpages accounting is described in details in

http://wiki.openvz.org/User_pages_accounting

A note about sys_mprotect: as it can change mapping state from
bc_vm_private to !bc_vm_private and vice-versa appropriate amount of
pages is (un)charged in mprotect_fixup.

Subject: [PATCH 9/13] BC: privvmpages accounting (hooks)
Posted by dev on Thu, 09 Nov 2006 16:57:24 GMT
View Forum Message <> Reply to Message

BC privvmpages accounting hooks in generic code.

Signed-Off-By: Pavel Emelianov <xemul@sw.ru>
Signed-Off-By: Kirill Korotaev <dev@sw.ru>

Subject: [PATCH 10/13] BC: physpages accounting (core)
Posted by dev on Thu, 09 Nov 2006 16:59:40 GMT
View Forum Message <> Reply to Message

This is the core of vmrss accounting.

The main introduced object is page_beancounter.
It ties together page and BCs which use the page.
page_beancounter also allows quick per-container pages reclamation.
and helps correctly account fractions of memory shared
between BCs (http://wiki.openvz.org/RSS_fractions_accounting)

Page charge/uncharge is performed on first map/last unmap
and is based on page->mapcount calculations.

Subject: [PATCH 11/13] BC: physpages accounting (hooks)
Posted by dev on Thu, 09 Nov 2006 17:01:28 GMT
View Forum Message <> Reply to Message

Introduce calls to BC code over the kernel to add
accounting of physical pages.

Subject: [PATCH 13/13] BC: numfiles accounting
Posted by dev on Thu, 09 Nov 2006 17:03:02 GMT
View Forum Message <> Reply to Message

Very simple beancounter for accounting and limiting
container number of opened files.

Maybe, but BCs are the only user of this so far...

Thanks,
Kirill

Why do we want to track each allocated _object_ in the slab? Isn't
tracking pages enough?

No #ifdef within functions, please, but instead, make it an static
inline function.

No. One page may contain objects allocated in different beancounters.

kernel memory is not accounted on a linux system
right now, and user can probably quite easily use
that for DoS ... shouldn't that become a separate
user limit in the first place?

> - virtual memory pages. BCs allow to
> limit a container to some amount of memory and

how much overhead does this add to the memory/page
management? do we really want to account shared pages
at all, if so, why is accounting a fraction to each
group the 'proper' way to do so? (would expect to
account it to all of them equally)

IMHO it would be sufficient to extend existing page
accounting to a 'memory' namespace isntead of adding
another complex mechanism like the beancounters

Isn't this a little heavyweight for moving a task into/between beancounters?

Paul

> beancounters?

It's a main reason we were against moving arbitrary task.

We need to track the situation when we change beancounter on
task that is currently handles an interrupt and thus set a
temporary BC as exec one. I see no other way that keeps pair
set_exec_bc()/get_exec_bc() lock-less.

The problem is even larger than I've described. set_exec_bc()
is used widely in OpenVZ beancounters to set temporary context
e.g. for skb handling. Thus we need some safe way to "catch"
the task in a "safe" place. In OpenVZ we solve this by moving
only current into beancounter. In this patch set we have to
move arbitrary task and thus - such complication.

I repeat - we can do this w/o stop_machine, but this would
require locking in set_exec_bc()/get_exec_bc() but it's too
bad. Moving tasks happens rarely but setting context is a
very common operation (e.g. in each interrupt).

We can do the following:

```
 if (tsk == current)
    /* fast way */
    tsk->exec_bc = bc;
 else
    /* slow way */
    stop_machine_run(...);
```

What do you think?

How about having two pointers per task:

- exec_bc, which is the one used for charging
- real_bc, which is the task's actual beancounter

at the start of irq, do

current->exec_bc = &init_bc;

at the end of irq, do

current->exec_bc = current->real_bc;

When moving a task to a different bc do:

task->real_bc = new_bc;
atomic_cmpxchg(&task->exec_bc, old_bc, new_bc);

(with appropriate memory barriers). So if the task is in an irq with a
modified exec_bc pointer, we do nothing, otherwise we update exec_bc
to point to the new real_bc.

Paul

You mean moving is like this:

old_bc = task->real_bc;
task->real_bc = new_bc;
cmpxchg(&tsk->exec_bc, old_bc, new_bc);

? Then this won't work:

Initialisation:
current->exec_bc = init_bc;
current->real_bc = init_bc;
...
IRQ:
current->exec_bc = init_bc;
...
                    old_bc = tsk->real_bc; /* init_bc */
                    tsk->real_bc = bc1;
                    cx(tsk->exec_bc, init_bc, bc1); /* ok */
...
Here at the middle of an interrupt

we have bc1 set as exec_bc on task
which IS wrong!
...
current->exec_bc =
	current->real_bc;

We need some way to be sure that task isn't running at
the moment we change it's beancounter. Otherwise we're
risking that we'll spoil some temporary context.

You could get round that by having a separate "irq_bc" that's never
valid for a task not in an interrupt.

Paul

No no no. This is not what is needed. You see, we do have to
set exec_bc as temporary (and atomic) context. Having temporary
context is 1. flexible 2. needed by beancounters' network accountig.
We have to track this particular scenario.

Moreover making get_exec_bc() as
if (in_interrupt())
 return &irq_bc;
else
 return current->exec_bc;
is awful. It must me simple and stupid to allow us making temporary
contexts in any place of code.

Maybe we can make smth similar to wait_task_inactive and change
it's beancounter before unlocking the runqueue?

I don't see why having an irq_bc wouldn't solve this. At the start of
the interrupt handler, set current->exec_bc to &irq_bc; at the end set
it to current->real_bc; use the cmpxchg() that I suggested to ensure
that you never update task->exec_bc from another task if it's not

equal to task->real_bc; use RCU to ensure that a beancounter is never
freed while someone might be accessing it.

That could work too.

Paul

Oh, I see. I just didn't get your idea. This will work, but
1. we separate interrupt accounting from all the others'
2. for interrupts only. In case we want to set init_bc as
   temporary context all will be broken...

We need some generic solution independent from what
exactly is set as temporary exec_bc.

Could work, but whether everyone will like such intrusion...
I agree that stop_machine isn't nicer. This is a temporary
solution that works for sure. Better one will follow...

I've got it! That's what will work:

```
struct task_struct {
 ...
 struct beancounter *exec_bc;
 struct beancounter *tmp_exec_bc; /* is set to NULL on
                                   * tsk creation
                                   */
};

struct beancounter get_exec_bc(void)
{
 if (current->tmp_exec_bc)
  return current->tmp_exec_bc;
 return rcu_dereference(current->exec_bc);
}
```

```
struct beancounter set_tmp_exec_bc(struct beancounter *new)
{
 struct beancounter *old;

 old = current->tmp_exec_bc;
 current->tmp_exec_bc = new;
 return old;
}

void reset_tmp_exec_bc(struct beancounter *expected_old)
{
 BUG_ON(current->tmp_exec_bc != expected_old);
 current->tmp_exec_bc = NULL;
}

void move_task(struct task_struct *tsk, struct beancounter *bc)
{
 struct beancounter *old;

 mutex_lock(&tsk_move_mutex);
 old = tsk->exec_bc;
 get_bc(bc);
 rcu_assign_pointer(current->exec_bc, bc);
 syncronize_rcu();
 mutex_unlock(&tsk_move_mutex);

 bc_put(old);
}
```

I will implement this in the next beancounter patches.
Thanks for discussion :)

Don't forget that this means all callers need to be in an
rcu_read_lock() section.

>
> I will implement this in the next beancounter patches.

This is looking remarkably like the mechanism in use for my generic
containers patches (inherited from Paul Jackson's cpusets code). In
the last set of patches that I posted on Wednesday night, I included
the example of the beancounters core and numfiles counter implemented
on top of the generic containers - basically pulling out the hash
table, refcounting and most of the configfs code (since that's handled
by the generic containers), and moving the attribute management
configfs code to the use the containerfs filesystem interface instead.
The rest is pretty much unchanged.

I think you could continue to use the tmp_exec_bc idea with this, and
have get_exec_bc() use the tmp_exec_bc if it existed, or else get the
bc pointer via the container system.

I'd appreciate any feedback you had on that approach.

Paul

Sure. This is done for these particular cases.

I'll look through your patches this week and send my opinion.
