Hi,

I am looking for someone who can either in writing or directly on my server do the following:

install all software and templates such that I can then ssh to the server and easily create new vm's.

I am familiar with commerical virtuozzo but I do not have the time to spend on figuring out the the open version. I imagine it is pretty similiar.

I want to be able to take your instructions, do a clean install myself (because I'm paranoid!) and then be able to create new vm's from the command line, start them, etc.

It will be installed to RedHat EL3. I want to be able to make VM's that run CentOS and others.

I am willing to pay for this. Let me know what you can offer.

Thanks!

You can PM me or update this thread.

1. why do you want RHEL3? it's was not designed for 2.6 kernels though it works with some tweaks with it. I'd recommend RHEL4.
2. just give us credentials.

3. which arch do you want? i386 or x86-64 (emt64)?
4. which templates do you want?
right now we have:
centos-4
debian-3.1
fedora-core-3
fedora-core-4

opensuse-10 (beta)
all these come in "minimal" and "default" flavours.
