Hi
I installed this kernel ovzkernel-smp-2.6.9-023stab032.1.x86_64.rpm on my FC6 and I would like
to run samba (3.0.23c-2) but when I try to start it I have this strange error on smbd.log:

Fatal: no entropy gathering module detected

What does it mean?
I'm trying to start samba as domain member whith ldap backend

If I start my server whith the kernel "standard" i don't have any problems

Help me please

I tried but I had problem with raid5, I read that kernel don't support raid5 for now...so I think I have
to wait!!!
