Subject: java urlencode problem

Hi,

I've recently made use of Openvz in our environment. My experience is that it works very well.
Our servers are mainly Apache/Tomcat webservers and I use Centos-default template. However,
I've stumbled across one thing that I've not been able to solve its that
url-encode-ing behaves differently on the VE than on the host it selv. That is to say when I
urlencode for example "árar" I get from the VE

%3Frar
%3Frar

but on the host I get

%E1rar
%E1rar

which what I expected. I've made a small test rutine in java to test it, I pasted it in here below.

I wonder if any of you have come across this? All help would be greatly appreciated.

TIA

Arnar
-------------------------- Code snip ------------------
```java
import java.net.*;
import java.io.*;

public class urlenctest {

    /**
     * @param args
     */
    public static void main(String[] args) {
        // TODO Auto-generated method stub
        String enc="";
        try{
            if( args.length > 1 ){
                enc = args[1];
            }
            System.out.println(URLEncoder.encode(args[0]));
          System.out.println(URLEncoder.encode(args[0], enc));
        }catch( UnsupportedEncodingException ue ){
            ue.printStackTrace();
        }
```

```
        }

}
```

I guess you have different default locales on the host and inside VE:
echo $LANG
set | grep LC

also please keep in mind, that some of the templates have no other locales except for C. So you
need to make:
rpm -ihv --force glibc-common.rpm
in order to restore all locales.
Search forum for this.

Hi,

sorry but my initial email didn't contain everything i had done. I had already tryied to tweak the
LANG environment and both the host and the VE have now

en_US.iso8859-1

set|grep LC

gives nothing in both servers and glibc-common is already installed. I'm using Centos default
template if that says anything. Do you believe I need to reinstall glibc-common?

yes, you need to reinstall, since some templates have stripped locales(!) for much smaller size.

Hi guys,

this solved the issue. The thing is to fetch the glibc-common from the original distribution.

Thanks for the help.

BR.
