Hi,

During the last weeks my primary HN have crashed a few times.

Netconsole Reports = None

Logs = None

Load Average > 300 (Dual Core CPU)

```
[root@vps1 ~]# vzmemcheck
```

Output values in %

LowMem	LowMem	RAM	MemSwap	MemSwap	Alloc	Alloc	Alloc
util	commit	util	util	commit	util	commit	limit
2.75	33.63	20.99	6.79	22.86	15.58	22.33	48.34

```
[root@vps1 ~]# vzcpucheck
```

Current CPU utilization: 132684

Power of the node: 228284

CPU Limit (50 per VPS)

All config files are checked by verify utility and are valid.

Since there are no logs i'm unable to trace the problem, anyone have suggestions?

Thanks in advance,

Hello,

What kernel do you use?

Is it possible for you to attach serial console to the node in question?

Have you tested hardware? (http://wiki.openvz.org/Hardware_testing)

Thanks,

Vasily.

I'm using the latest stable kernel 2.6.9-023stab037.3-smp

Netconsole is completely empty

And hardware passed in all tests (CPU, mem)

I'd recommend to setup serial console and increase console log level to maximum (i.e. 'echo "8 1 4 8" > /proc/sys/kernel/printk').
Netconsole is less reliable, than serial one. If it is impossible, even monitor output photo will be useful. Without info we can do nothing.

Since i'm unable to find the problem i'm going to reload the box, now when i tried to migrate the VE's i get the following:

```
Starting online migration of VE 109 on 10.0.0.28
OpenVZ is running...
Preparing remote node
Initializing remote quota
Syncing private
Live migrating VE
Setting up checkpoint...
Error: No checkpointing support, unable to open /proc/cpt: No such file or directory
Failed to suspend VE
```

```
[root@vps1 /]# modprobe vzrst
[root@vps1 /]# modprobe vzcpt
[root@vps1 /]# uname -a
Linux inf1 2.6.9-023stab037.3-smp #1 SMP Wed Dec 13 19:31:35 MSK 2006 x86_64 x86_64
x86_64 GNU/Linux
```

Shouldn't vzctp be available?

Are modules (vzcpt, vzrst) loaded on both nodes (source and destination)?

Thanks,
Vasily.
