
Subject: *SOLVED* VZ fails to start cleanly on reboot

I'm curious if anyone else has seen this behaviour, which has hit me twice now in the past ~6 weeks (power failues, yay)

- machine shuts itself down gracefully via UPS monitoring software
- when power is restored, machine boots up automatically
- machine boots normally, but OpenVZ virtual hosts fail to come online
- when I connect to machine, I can then manually use
"/etc/init.d/vz restart" and vzhosts come up cleanly this time, no problems at all.
- machine was patched to latest OpenVZ using OpenVZ YUM repos last month. See below for exact details on machine,platform,versions and logged errors.

Many thanks for any assistance,

--Tim

MACHINE INFO:

=====

- AMD AthlonX2 2000mhz machine running CentOS 32-bit
- using stock OpenVZ kernel installed from Yum Repo from OpenVZ:
- vzctl version is 3.0.13

```
[root@hydra log]# uname -a
Linux hydra.....ca 2.6.9-023stab037.3-smp #1 SMP Wed Dec 13 19:33:33 MSK 2006 i686 athlon
i386 GNU/Linux
```

```
[root@hydra log]# vzctl
vzctl version 3.0.13
Copyright (C) 2000-2006 SWsoft.
...
```

SYMPTOM AFTER FIRST CONNECT AND THEN RESTART:

=====

--paste--

```
[root@hydra ~]# vzlist

Hello,

1) Is the situation, that after reboot of the node, VEs don't start automatically reproducable every time?

2) Can you provide us a part of /var/log/message, that corresponds to system boot, when VE don't start automatically.

Thanks,
Vasily.

Hi,

Yes - this is consistent behaviour. we had another power fail last night (insane!) and the behaviour is identical. Virtual hosts didn't auto-start, but login as root I was able to issue a "restart" with the init script which brought up the virtual hosts just fine.

I'm trolling the logfile as per your request, and I have trouble finding anything which cites specifically OpenVZ. best hits I've got are shown below:

Jan 8 18:25:57 hydra kernel: Virtuozzo Fair CPU scheduler
Jan 8 18:25:57 hydra kernel: Built 1 zonelists

I can't see anything in my /var/log/boot.log either.

The best thing I can find, as per my original post, is logged in /var/log/vzctl.log, where I see:

CONTROLLED SHUTDOWN UNDERWAY - ENDING:

2007-01-08T18:06:52-0400 vzctl : VE 236 : VE is unmounted

POWER IS RESTORED, MACHINE COMES UP ON ITS OWN:

2007-01-08T18:30:01-0400 venetclean : VE 236 : VE died, clear IPs:

2007-01-08T18:30:01-0400 venetclean : VE 237 : VE died, clear IPs:

2007-01-08T18:30:01-0400 venetclean : VE 238 : VE died, clear IPs:

2007-01-08T18:30:01-0400 venetclean : VE 239 : VE died, clear IPs:

I CONNECT AS ROOT REMOTELY AND RESTART VZ SERVICE:

2007-01-08T18:55:42-0400 vzctl : Setting CPU units: 1000

2007-01-08T18:55:42-0400 vzctl : WARNING: Settings were not saved and will be resetted to original values on next start (use --save flag)

2007-01-08T18:55:42-0400 vzctl : VE 236 : Starting VE ...

2007-01-08T18:55:42-0400 vzctl : VE 236 : VE is mounted

2007-01-08T18:55:42-0400 vzctl : VE 236 : Adding IP address(es): 129.XXX.XXX.236

2007-01-08T18:55:46-0400 vzctl : VE 236 : Setting CPU units: 22327

2007-01-08T18:55:46-0400 vzctl : VE 236 : Set hostname: polyp.phys.XX.XY.ca

2007-01-08T18:55:46-0400 vzctl : VE 236 : File resolv.conf was modified

2007-01-08T18:55:46-0400 vzctl : VE 236 : VE start in progress...

OTHER VZHOSTS COME UP FINE AS PER THIS ONE SHOWN ABOVE (there are 5 vzhosts on this machine in total)

It appears from the vzctl.log that an attempt is made to bring up all of the virtual hosts, but then errors result ending with "VE Died Clear IPs" for each host, one after the other...

If you can make suggestions about other logging I should be able to observe, it would be appreciated. Hopefully (?) what is above is of some use (?)

Thanks for your help with this,

Tim Chipman

Hi,

Just wanted to update this thread, since things have evolved recently somewhat.

I just rolled yesterday a yum-update on the machine in question, which pulled automagically from

the OpenVZ Yum Repo the newest (Jan-07) official kernel build, (2.6.9-023stab040.1 I believe)

After this yum update and a reboot using the new kernel, I was very happy to see that all my virtual hosts started correctly while the physical host was booting up.

So - I'm still not precisely certain what the problem was, but it seems to be resolved for now.
