Well after posting on 6 forums so far with no answers and my hosting company goDaddy leaving me to fend for myself I am really down and hope that someone can offer just the slightest bit of guidance.

Win03 server  
Virtuozzo VPS  
goDaddy  
logging onto server via Win XP's remote desktop (by IP)

- tried to install McAfee VirusScan 8.0i- could not contact filter driver
- tried to install PerfectDisk 7- cannot communicate with PDengine
- tried to install Alcohol120, installation error
- tried to install DAEMON tools- setup required reboot but on restart install would not complete.

CAN SOMEONE PLEEEASE ADVISE THE NATURE OF INSTALLS ON VPS AND what is going on here?

very grateful-

Ehh... this is a Virtuozzo question and I believe only your hosting company can provide you support. If they need help they can talk to swsoft.

OpenvZ has nothing to do with Windows..
