Subject: gentoo baselayout 1.13 openvz modifications

Hello,

I was checking the stuff added to Gentoo's baselayout 1.13 to make it compatible with VPS systems like Linux-VServer or OpenVZ.

Everything looks great, the only minor problem I found is this code in bootmisc:

```
if [[ $(uname) == "Linux" ]]  && ! is_vps_sys ; then
      # BSD has it's own sysctl init script
      if [[ -e /etc/sysctl.conf ]] ; then
            ebegin $"Configuring kernel parameters"
            sysctl -q -p /etc/sysctl.conf
            eend $?
      fi
fi
```

The problem here is in OpenVZ some of sysctl variables are virtualized, i.e. you can set it from inside your VE. Usually this is not needed, and not too many people do that, but still if there is /etc/sysctl.conf people expect that it will be applied during VE start.

Surely this is minor problem and it does not cry for fixing it now. Still, at the very least it would be helpful to add FIXME or TODO-like comment in the code.

Regards,
  Kir.

PS version checked is baselayout-1.13.0_alpha12

Hollow asked for that for a reason. I'll assume that he's on the
vserver-devs@gentoo.org mailing list and he'll tell me why.

Otherwise I have no problem with punting it myself.

Thanks

Roy

Yeah, we can punt that...
