View Forum Message <> Reply to Message

Hi all,
i read many many posts about vserver VS OpenVZ so here i am

I would like to try it but i am not able to compile kernel after patch.

I receive a lot of hunks during patching kernel and after make menuconfig when i did make bzImage ld error and die.

I read that kernel patch was tested only on redhat and CENTOS..

There is no way to install OpenVZ on a debian system ?

Thanks in advance

Probably you patch kernel-source of wrong version or it from your distr.

You should get kernel from http://www.kernel.org 2.6.8)
and apply patch to it, or get already patched, full version from here:
  http://download.openvz.org/kernel/022stab061.1/ovzkernel-2.6 .8-022stab061.1.src.rpm

Subject: Re: OpenVZ and Debian

View Forum Message <> Reply to Message

No.
I downloaded 2.6.8 from kernel.org and after applied patch.

Anyway i will try rpm source and let you know.

Subject: Re: OpenVZ and Debian

Posted by [adebisi](#) on Mon, 16 Jan 2006 00:27:56 GMT

My fault.

I downloaded 2.6.0 instead of 2.6.8

I am really sorry to let you loose time about my errors.

Subject: Re: OpenVZ and Debian

kernel/built-in.o(.text+0x2629a): In function `init_ve_sysfs':
: undefined reference to `net_class'
make: *** [.tmp_vmlinux1] Error 1

If i try to compile as modules i receive of course another error like undefined symbol and so on..

Where i am wrong ?

View Forum Message <> Reply to Message

First I hope that OpenVZ patch applied well, there was no rejects and so on.

Second, it is hard to tell what's wrong without having your .config. Note that some combinations won't work (see bug #52).

So, you'd better take one of the existing configs from http://download.openvz.org/kernel/current/configs/ and put is as .config to your source tree, then run make oldconfig and compile the kernel as usual. Or check bug #52 for known issues and change config options accordingly.

View Forum Message <> Reply to Message

Patch was applied well.
Problem was .config but with your help and after read your instructions everything works now.

Thanks a lot all

mmm
kernel works but after i install from source vzctl i receive this error when try to start /etc/init.d/vz

/etc/init.d/vz: line 26: /etc/rc.d/init.d/functions: No such file or directory

Anyway i did a find to try where possible file functions is and this are results:

/usr/lib/vzctl/scripts/vps-functions

i need to use this one instead or there is another solution?

I read also this thread:
 http://forum.openvz.org/index.php?t=tree&th=184&mid= 822&&rev=&reveal=
but i cant still solve problem.

What do you suggest ?

Subject: Re: OpenVZ and Debian
Posted by kir on Mon, 16 Jan 2006 13:53:21 GMT

Debian needs its own init script, since it is not like RedHat or Gentoo. Currently we have one for RedHat-like systems (included into vzctl rpm) and the one for Gentoo systems (available from Gentoo portage).

So it needs to be written...even by you, if you take a look at other scripts from the same directory and see what do they do to print success/error messages and so on. I can definitely help.

Subject: Re: OpenVZ and Debian
Posted by adebisi on Mon, 16 Jan 2006 21:25:38 GMT

Ok looklike it works now.

I am actually trying to create a vs debian.

Anyway i had to add following to your init script:

(from functions file taken from redhat 9)

Quote:
#. /etc/rc.d/init.d/functions

```
action() {
 STRING=$1
 echo -n "$STRING "
 shift
 #initlog $INITLOG_ARGS -c "$*" && success $"$STRING" || failure $"$STRING"
 rc=$?
 echo
 return $rc
}

echo_success() {
  [ "$BOOTUP" = "color" ] && $MOVE_TO_COL
    echo -n "[ "
     [ "$BOOTUP" = "color" ] && $SETCOLOR_SUCCESS
      echo -n $"OK"
       [ "$BOOTUP" = "color" ] && $SETCOLOR_NORMAL
        echo -n "  ]"
         echo -ne "\r"
                return 0
                }
```

```
success() {
#  if [ -z "${IN_INITLOG:-}" ]; then
#     initlog $INITLOG_ARGS -n $0 -s "$1" -e 1
#       else
    # silly hack to avoid EPIPE killing rc.sysinit
      trap "" SIGPIPE
#     echo "$0  \"$1\" 1" >&21
        trap - SIGPIPE
      [ "$BOOTUP" != "verbose" -a -z "$LSB" ] && echo_success
      return 0
      }
#Disable everywhere initlog command cause i didnt find any #initlog package for debian.
```

Of course i could also create a file functions with these functions and let your script include it.

I used your binary packages to do that.

So .. i am checking and let you know if it works totally or not.

Subject: Re: OpenVZ and Debian

View Forum Message <> Reply to Message

So
if i try to include those functions in a file and then include that file in vz init script without comment anything it looklike works fine but..

After deboostrapped and done some configuration like in kir debian template tutorial i receive the following error:

Quote:
 vzctl start 777
Starting VPS ...
VPS is mounted
Adding IP address(es): 1.1.1.7
arpsend: unknown iface eth : No such device
vps-net_add WARNING: arpsend -c 1 -w 1 -D -e 1.1.1.7 eth FAILED
RTNETLINK answers: Network is down
vps-net_add ERROR: Unable to add route /sbin/ip route add 1.1.1.7 dev venet0 src 1.1.1.11
VPS start failed
Stopping VPS ...
VPS was stopped
vzquota : (error) Quota off syscall for id 777: Device or resource busy
vzquota setlimit -f failed [3]
VPS is unmounted

Ethernet module or anyway ethernet config has some problem and quota looklike have too.

Checking and checking...

Adding IP address(es): 1.1.1.6
Running: /usr/lib/vzctl/scripts/vps-net_add
arpsend: unknown iface eth : No such device
vps-net_add WARNING: arpsend -c 1 -w 1 -D -e 1.1.1.6 eth FAILED
RTNETLINK answers: Network is down
vps-net_add ERROR: Unable to add route /sbin/ip route add 1.1.1.6 dev venet0 src 1.1.1.11

iface eth ? not eth0 ? help needed :d

Can you post the output of '/sbin/ip a l; /sbin/ip r l' here?

Subject: Re: OpenVZ and Debian
Posted by adebisi on Tue, 17 Jan 2006 07:59:22 GMT
View Forum Message <> Reply to Message

vps:~# /sbin/ip a l
1: lo: <LOOPBACK,UP> mtu 16436 qdisc noqueue
    link/loopback 00:00:00:00:00:00 brd 00:00:00:00:00:00
    inet 127.0.0.1/8 scope host lo
2: eth0: <BROADCAST,MULTICAST,UP> mtu 1500 qdisc pfifo_fast qlen 1000
    link/ether 00:13:8f:0c:16:de brd ff:ff:ff:ff:ff:ff
    inet 1.1.1.11/28 brd 1.1.1.15 scope global eth0

vps:~# /sbin/ip r l
1.1.1.0/28 dev eth0 proto kernel scope link src 1.1.1.11
default via 1.1.1.14 dev eth0

address and route looklike work well

Subject: Re: OpenVZ and Debian
Posted by kir on Tue, 17 Jan 2006 08:29:15 GMT
View Forum Message <> Reply to Message

It looks like venet0 device is not up.

It happened because in the stuff you added to /etc/init.d/vz there is a shell function called 'action' which should execute the command -- and you commented out that actual command execution:

 #initlog $INITLOG_ARGS -c "$*" && success $"$STRING" || failure $"$STRING"

Please put something like this instead of the above line:
$* && success $"$STRING" || failure $"$STRING"

so the actual code passed into the function will be executed.

Alternatively, to set up venet0 device, you have to do the following:

modprobe vznetdev
modprobe vznet
ip link set venet0 up
ip addr add 0.0.0.0/0 dev venet0
sysctl -w net.ipv4.conf.venet0.send_redirects=0

Subject: Re: OpenVZ and Debian
Posted by adebisi on Tue, 17 Jan 2006 13:35:57 GMT
View Forum Message <> Reply to Message

it works.

Quote:Please put something like this instead of the above line:

$* && success $"$STRING" || failure $"$STRING"

I just need this on functions file.

That's my functions file if you need:

Quote:vps:~# cat /etc/init.d/functions
action() {
STRING=$1
echo -n "$STRING "
shift
$"$STRING"
$* && success $"$STRING" || failure $"$STRING"
rc=$?
echo
return $rc
}

echo_success() {

```
[ "$BOOTUP" = "color" ] && $MOVE_TO_COL
echo -n "[ "
[ "$BOOTUP" = "color" ] && $SETCOLOR_SUCCESS
echo -n $"OK"
[ "$BOOTUP" = "color" ] && $SETCOLOR_NORMAL
echo -n " ]"
echo -ne "\r"
return 0
}

success() {
trap - SIGPIPE
[ "$BOOTUP" != "verbose" -a -z "$LSB" ] && echo_success
return 0
}
```

Thanks for all!

Quote:Vps starts but when i login i am not able to ping or connect to any host.

First, you should use *real* IP address for you VPS, if you want to be able to access internet from it.

Second, you probably missed setting nameserver inside a VPS.

Quote:Running: /usr/lib/vzctl/scripts/vps-net_add
arpsend: unknown iface eth : No such device
vps-net_add WARNING: arpsend -c 1 -w 1 -D -e 1.1.1.7 eth FAILED

Can you please execute the following like and post its output here?
. /usr/lib/vzctl/scripts/vps-functions && vzgetnetdev && echo $NETDEVICES

Subject: Re: OpenVZ and Debian
Posted by adebisi on Tue, 17 Jan 2006 15:08:06 GMT

Quote:. /usr/lib/vzctl/scripts/vps-functions && vzgetnetdev && echo $NETDEVICES
eth

Anyway i try to contact ip on my lan such 1.1.1.1 or 1.1.1.14 for example and after i tried to go out just ping ip so i dont need for this dns settings.

Should i enable nat to share connection ?

Subject: Re: OpenVZ and Debian
Posted by kir on Tue, 17 Jan 2006 15:21:40 GMT

For the troubleshotting, can you please post the output of these two commands here?

/sbin/ip link list | egrep -v -E 'LOOPBACK|NOARP|SLAVE'

/sbin/ip link list | egrep -v -E 'LOOPBACK|NOARP|SLAVE' | awk '/^[0-9].*:/&&/UP/ {print substr($2, 0, length($2)-1)}'

Subject: Re: OpenVZ and Debian
Posted by kir on Tue, 17 Jan 2006 15:24:44 GMT

It is not clear whether you should use NAT or not - I do not know your network setup...

Some networking problems are caused by the fact that ppl forgot to enable IP forwarding (net.ipv4.ip_forward = 1). For details, see Quick Install document.

Subject: Re: OpenVZ and Debian

View Forum Message <> Reply to Message

So I assume you use NAT somethere on the gateway...no need to NAT at OpenVZ box then.

Subject: Re: OpenVZ and Debian

        collisions:0 txqueuelen:0
        RX bytes:168 (168.0 b) TX bytes:168 (168.0 b)

venet0   Link encap:UNSPEC HWaddr 00-00-FF-00-00-00-00-00-00-00-00-00-00-00-00-00
        inet addr:127.0.0.1 P-t-P:127.0.0.1 Bcast:0.0.0.0 Mask:255.255.255.255
        UP BROADCAST POINTOPOINT RUNNING NOARP MTU:1500 Metric:1
        RX packets:0 errors:0 dropped:0 overruns:0 frame:0
        TX packets:2 errors:0 dropped:0 overruns:0 carrier:0
        collisions:0 txqueuelen:0
        RX bytes:0 (0.0 b) TX bytes:98 (98.0 b)

venet0:0 Link encap:UNSPEC HWaddr 00-00-FF-FF-FF-FF-00-00-00-00-00-00-00-00-00-00
        inet addr:1.1.1.8 P-t-P:1.1.1.8 Bcast:0.0.0.0 Mask:255.255.255.255
        UP BROADCAST POINTOPOINT RUNNING NOARP MTU:1500 Metric:1

Outside vps guest this is route:

Quote:Kernel IP routing table

Destination	Gateway	Genmask	Flags	Metric	Ref	Use	Iface
1.1.1.8	0.0.0.0	255.255.255.255	UH	0	0	0	venet0
1.1.1.0	0.0.0.0	255.255.255.240	U	0	0	0	eth0
0.0.0.0	1.1.1.14	0.0.0.0	UG	0	0	0	eth0

and this is ip addr output:
Quote:
1: lo: <LOOPBACK,UP> mtu 16436 qdisc noqueue
    link/loopback 00:00:00:00:00:00 brd 00:00:00:00:00:00
    inet 127.0.0.1/8 scope host lo
2: eth0: <BROADCAST,MULTICAST,UP> mtu 1500 qdisc pfifo_fast qlen 1000
    link/ether 00:13:8f:0c:16:de brd ff:ff:ff:ff:ff:ff
    inet 1.1.1.11/28 brd 1.1.1.15 scope global eth0
3: venet0: <BROADCAST,POINTOPOINT,NOARP,UP> mtu 1500 qdisc noqueue
    link/void

this is sysctl.conf:

Quote:#OPENVZ#

# On Hardware Node we generally need
# packet forwarding enabled and proxy arp disabled
net.ipv4.ip_forward = 1
net.ipv4.conf.default.proxy_arp = 0
# Enables source route verification
net.ipv4.conf.all.rp_filter = 1
# Enables the magic-sysrq key
kernel.sysrq = 1
# TCP Explict Congestion Notification
#net.ipv4.tcp_ecn = 0
# we do not want all our interfaces to send redirects
net.ipv4.conf.default.send_redirects = 1
net.ipv4.conf.all.send_redirects = 0

That's all

Where i am wrong ?

kir wrote on Tue, 17 January 2006 16:21For the troubleshotting, can you please post the output of these two commands here?

/sbin/ip link list | egrep -v -E 'LOOPBACK|NOARP|SLAVE'

/sbin/ip link list | egrep -v -E 'LOOPBACK|NOARP|SLAVE' | awk '/^[0-9].*:/&&/UP/ {print substr($2, 0, length($2)-1)}'

The output is eth but it should be eth0.

The solution is to change the awk script that the output is eth0.

/sbin/ip link list | egrep -v -E 'LOOPBACK|NOARP|SLAVE' | awk '/^[0-9].*:/&&/UP/ {print substr($2, 0, length($2))}'

regards
ralph

phlar,

The problem is if I execute the command you give on my Fedora Core 4 box, it will give me 'eth0:' i.e. with comma which should be stripped off. Looks like debian awk and fedora core awk do not agree on the syntax of substr.

[kir@kir ~]$ /sbin/ip link list | egrep -v -E 'LOOPBACK|NOARP|SLAVE' | awk '/^[0-9].*:/&&/UP/ {print substr($2, 0, length($2))}'
eth0:

So what I propose is to use this construct:
/sbin/ip link list | egrep -v -E 'LOOPBACK|NOARP|SLAVE' | awk '/^[0-9].*:/&&/UP/ {print $2}' | tr -d ':'

It should work fine everythere

agree on the syntax of substr.

Yes, i suspect that the debian-awk starts not at the index zero. The first position is 1 not 0. And it is possible to start at positions lower than zero.

```
openvz:~# echo "test"|awk '{print substr($1,1,4)}'
test
openvz:~# echo "test"|awk '{print substr($1,0,4)}'
tes
openvz:~# echo "test"|awk '{print substr($1,-1,4)}'
te
```
