Subject: *SOLVED* ovzkernel-2.6.9 and lvm2?
Posted by Ynusis on Mon, 29 Jan 2007 12:15:34 GMT

I installed ovzkernel-2.6.9-023stab037.3.i686.rpm kernel and now i trie to use lvm, but i get this error:

lvm
lvm> version
LVM version: 2.02.06 (2006-05-12)
Library version: 1.02.07 (2006-05-11)
Driver version: 4.5.0
lvm> quit
Exiting.

vgscan
Reading all physical volumes. This may take a while...
No volume groups found
vgchange -a y
No volume groups found
pvcreate /dev/hda2 /dev/hdc2
/var/lock/lvm/P_orphans: open failed: Input/output error
Can't get lock for orphan PVs
/var/lock/lvm/P_orphans: open failed: Input/output error
Can't get lock for orphan PVs

hda2 and hdc2 are 8e Linux LVM.

I dont't know if this is a problem caused by the kernel?
I cant find this error in google, this errors seems to be not very popular
I use fedora core 4.

Hello,

Does the problem appear only on OpenVZ kernel?
What does vgscan output, when the FC4 default kernel is booted?

Thanks,
Vasily.
