Hello,
I'm having a little trouble on installing openvz

I get the following error:

grubby fatal error: unable to find a suitable template

Installed: ovzkernel.i686 0:2.6.9-023stab040.1
Complete!

The Kernel currently installed on the server is centos 2.6.9-42.0.8.EL

Help is more then welcome.

Best Regards,
Ryan

do you follow every single step of wiki installation instruction? with centos it should be no issue so far. may try re-install or try on mailing list also.

Hello,

As far as I understand, this is pretty harmless message.

OpenVZ kernel rpm packet uses grubby utility during installation to add a boot record to /boot/grub.conf or /boot/menu.lst. This record should contain arguments to be passed to the kernel while booting and grubby gets these arguments from other records in grub.conf (menu.lst). grubby calls this arguments "template". While searching "template" grubby do some sanity checks, that can fail for various reasons. This happens in your case. Note, grubby "template" is not related to OpenVZ templates. You can get more information on grubby's man-page.

So, the only thing you need to do is to check grub.conf for proper record for OpenVZ kernel.

HTH,
Vasily.
