Subject: VE's and OVZ kernel versions...

Please pardon my ignorance... I am just a VPS end-user trying to figure out things...
I login into a remote system which has been setup by my VPS provider:

cat /etc/fedora-release
Fedora Core release 5 (Bordeaux) ...that tells me that my VE is based on a FC5 template

uname -rv
2.6.18-028test015 #1 SMP ...that tells me that the VPS provider has installed a openVZ kernel,
built from source, based on the latest development version.

1) Is my understanding correct?
2) Since security fixes are backported to the latest openVZ stable kernel,
why would the VPS provider use a non-stable version?
3) I apply FC5 security fixes to my VE via yum. As FC7 is already out, soon fixes
for FC5 will not be provided anymore. Yet I don't see a template for FC6. How come?
4) Would it be possible for me to upgrade from FC5 to FC6 via yum (as doable on a
dedicated server) without the VPS provider intervention?

thank you for your patience,

Skizzo

Hello,

Quote:1) Is my understanding correct?
Yes, you're right.

Quote:2) Since security fixes are backported to the latest openVZ stable kernel, why would the
VPS provider use a non-stable version?
Development version is based on 2.6.18 vanilla kernel, which has a lot of new features/drivers/etc.
Moreover OpenVZ development kernel also has some interesting features (virtualized NFS, etc).
These facts probably force your provider to use development kernel.

dedicated server) without the VPS provider intervention?

You have a VE and you can do everything in it. You can even upgrade it to FC6. For example, use article: http://www.ioncannon.net/system-administration/99/upgrade-fc 5-to-fc6-with-yum/
However some problems could arise... I never checked it, so consult with your provider.
Or maybe somebody at forum tried that?

HTH,
Vasily
