
Subject: *SOLVED* Random Crashes

Posted by [webmotive](#) on Mon, 19 Feb 2007 12:00:23 GMT

[View Forum Message](#) <> [Reply to Message](#)

Hi Members of the Support Forum,

i post this here and not at the Bugs section - because iam not really sure we are talking about a bug or some misconfiguration on our side.

We are using OpenVz since some weeks and have random crashes of the whole machine. We made sure that the hardware is not the cause by moving all the stuff to a different server (same hardware config though).

Now we are sure now that it is not a memory or cpu failure. But it could still be some kind of conflict between some hardware components and the VZKernel ...?

There are no debug messages in the syslog that are of any use ...

When the machine crashes it is still possible to ping it for a while. After that it is not even possible to ping it any more.

We had to change the beancounters very much - otherwise we were getting errors about open,files etc, (see further down)

The crash seems to occur when load goes up. Any Ideas where we should start to search? Monitoring the beancounters did not give us a hint.

At the moment we definitely can't use the system for production ...

Very strange all together ...

Thanks

Christian

Hello,

You're using the very old kernel! There were a lot of memory leaks and other bugs. Please, upgrade till 2.6.18-028test015, and report us, if the problem persists.

Thank you,
Vasily

Vasily Tarasov wrote on Mon, 19 February 2007 07:21Hello,

You're using the very old kernel! There were a lot of memory leaks and other bugs. Please, upgrade till 2.6.18-028test015, and report us, if the problem persists.

Ok, now we have a new kernel and 1.5 hours later, we have the next 'crash'.

it is running:

```
# cat /proc/version
Linux version 2.6.18-028test015-grisu-ovz028test015.1
```

and after some time (the backup-script with some IO was running) the maschin begin to crash.

You can't start a real ssh connection on the computer, but 'ssh root@XXXX uptime' was working, 'ssh root@XXXX bash' also.

If I typed 'date', I get a 'permission deny'?!

After this I push reset and now the computer is running... I wait for the next crash.

Some new ideas?

Thanks

Grisu

Sounds strange enough to be a result of a hacked system. If you have an extra partition, I'd suggest reinstalling the system from scratch on a separate partition. Since you do appear have extra hardware perhaps you could use it instead just to eliminate that possibility. This is a long shot, but something to try.

Jim

Jim

Sorry, the ssh-problem was on the host-system and the hostsystem was reinstalled on both hardware. (we only copy the openvz's, not the whole disk)

Also the backup-script (faubackup) was running in the host-system.

At the time of the crash the openvz are running, but not in real use...

Thanks

Grisu

Hello,

It will be perfect, you'll post here:

- 1) full .config file you used, while compiling OpenVZ kernel in use
- 2) Your backup-script. Having it in hand we will be able to produce the same stress test locally and probably reproduce the crash.

It will be great, if you can set up a remote console and press magic keys while next crash (http://wiki.openvz.org/Remote_console_setup http://wiki.openvz.org/Magic_SysRq_Key)

Also you can compile OpenVZ kernel with official configs from openvz.org and check, is the problem reproducible with such kernels.

Thank you,

We appreciate you help very much,
Vasily

- 1) full .config file you used, while compiling OpenVZ kernel in use

see Attachment.

Quote:

- 2) Your backup-script. Having it in hand we will be able to produce the same stress test locally and probably reproduce the crash.

it is only:

```
/usr/sbin/faubackup --one-file-system 10.0.0.136:/data1
```

see <http://faubackup.sourceforge.net/>

Quote:

It will be great, if you can set up a remote console and press magic keys while next crash (http://wiki.openvz.org/Remote_console_setup http://wiki.openvz.org/Magic_SysRq_Key)

Ok, I start Remote_console_setup...

Quote:

Also you can compile OpenVZ kernel with official configs from openvz.org and check, is the problem reproducible with such kernels.

I download kernel-smp-2.6.18-ovz028test015.1.i686.rpm and I try to using this kernel after the next reboot...

Thanks for your help

Grisu

Hello,

Thanks for the cooperation. I look forward to information from you. Meanwhile in the evening I'll set your io-test on kernel compiled on your config.

Thanks.

The first infos:

we have 2.6.18-ovz028test015.1-sm running
the remote console is running

and we now waiting for the next crash.

Thanks

Grisu

Ok. I have new infos:

first we run the OVZ on the Server1 with the 2.6.18-ovz028test015.1-sm-Kernel. With out any problem. Uptime >10 Days. Nice. Your Kernel is running.

Yesterday I switch the OVZ back the the Server2 with the 2.6.18-ovz028test015.1-sm-Kernel. The Software ist the same, the HW also, with one exception: the server2 have a raid-controller

The Server2 crash after X hours... Hm.

I add the remote-console-output from both Server. One with the kernel-ops.

Maybe you see now the problem...

Thanks for your help....

Grisu

Hello,

sorry for the answer delay! Your crash seems to be a hardware related problem. Can you, please, run memtest and cpuburn on server2, where you had Ooops (http://wiki.openvz.org/Hardware_testing). Please, run cpuburn under non-OpenVZ kernel.

Thanks,
Vasily.

Hello

Thanks

Now we have checked the server and the company found a HW-error.

With the new server, openVz is working...

Thanks

Grisu
