Situation:

two hardware hodes with some vps. vps shold contact with service in VE0.

for example, syslog in VPS should sent all messages in VE0 syslog. i can set ip for first VE0 like
10.0.0.1, and for second 10.0.0.2 and set it in syslog.conf. But if i migrate vps from first to second
VE0, syslog from vps still send messages to first syslog.

Does  VE0 has one unique ip (like 127.0.0.1 for loopback)? Or how can i set it?

P.S. by route -n i see, that venet0 act as 192.0.2.1, but this ip exist only in routing table
